Team Ananya - Nagpur Heat Check

Background

A scooter-sharing system or kicksharing system is a shared transport service in which e-scooters are made available to use for short-term rentals. E-scooters are typically "dockless," meaning that they do not have a fixed home location and are dropped off and picked up from certain locations in the service area.

To rent a dockless e-scooter, users download a smartphone application. The application shows users a map of nearby e-scooters and enables them to unlock them. Scooters are equipped with built-in GPS chips and cellular connectivity which allows them to report their location in real time during a trip.

Our analysis

VoltRide should think carefully before spreading itself across three cities. Our analysis focuses on Nagpur, which has wide roads but extreme summer heat, and we worry that battery packs will degrade quickly when afternoon temperatures stay above forty five degrees for weeks.

We would start Nagpur with a smaller fleet of 250 scooters and run them only in the mornings and evenings during May and June. That limits revenue but protects the most expensive part of the vehicle.
